

MIX-fpga

Michael Schröder
mi.schroeder@netcologne.de

July 1, 2021

1. A real MIX

Have you ever heard of Don Knuth's (hypothetical) first polyunsaturated computer MIX, the 1009? In this project we will build a binary version of the MIX-Computer as described in "The Art of Computer Programming, Vol. 1" by Donald E. Knuth running on an fpga-board.

The presented implementation is based on the fpga development board iCE40HX8K-EVB from the company Olimex Ltd.¹, which has the nice property of being completely open source. The whole project uses only FOSS free and open source hard- and software, so everybody can build their own MIX following the instructions on the project site².

1.1. A look inside

The MIX computer is composed of two little boards:

¹www.olimex.com

²[www.gitlab.com/x653/mix-fpga](https://gitlab.com/x653/mix-fpga)

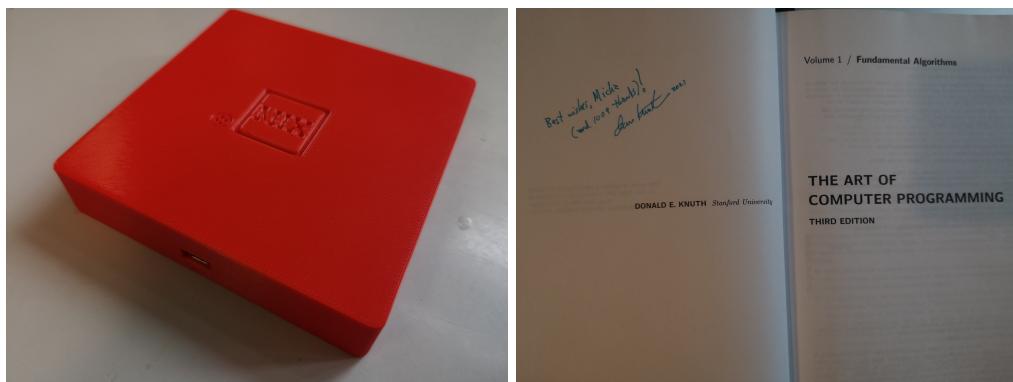

Figure 1: A real MIX for Don Knuth

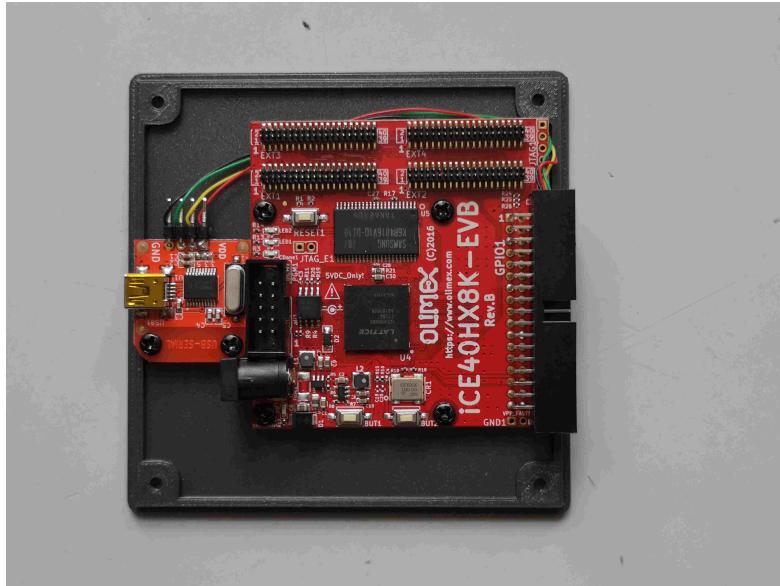

Figure 2: The two boards interconnected with wire wrap technique typical for computers of the 60s era

1. iCE40HX8K-EVB³, the fpga development board from the company Olimex Ltd.
2. USB-serial adapter⁴. Used to power the board with 5V and to in-/output data over the serial interface.

1.1.1. Basic unit of time

MIX runs on iCE40HX8K-EVB clocked at 23.8 MHz. The basic unit of time u corresponds to $1u = 42\text{ ns}$, so according to Knuth it's a relatively high priced machine.

1.1.2. Character based I/O units U16-U20

In our MIX implementation all character based I/O units (U16 – U20) are connected to the USB-connector and can be accessed as serial data streams. You can connect MIX with any PC running a terminal emulator (e.g. screen for linux). The terminal should be set to 115200 baud (8N1). A conversion between ASCII and Knuths character codes is done in hardware according to Knuths specification (see TAOCP p. 128).

1.1.3. The block based I/O unit U8

A block based device is implemented on I/O unit 8. The device acts as a disk with 1000 blocks à 100 words. The data is stored in the SRAM chip included on the iCE40HX8K-

³www.olimex.com/Products/FPGA/iCE40/iCE40HX8K-EVB

⁴www.olimex.com/Products/Breadboarding/BB-CH340T

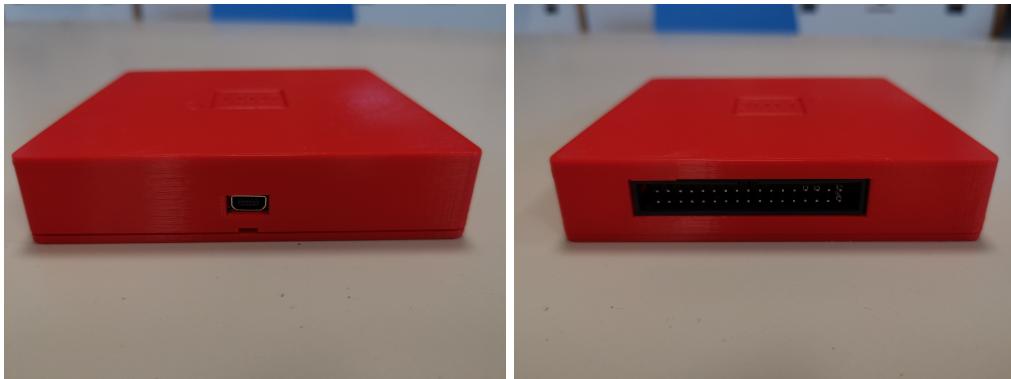

Figure 3: All character based I/O is done through a USB to serial adapter @115200 baud (8N1). MIX can be expanded through a GPIO connector placed at the rear side

EVB board. The speed of read and write operations is exactly 401μ for reading or writing one complete block of data (no **JBUS** is needed). The data stored to unit U8 can be retrieved also after a reset (GO-Button). But on a full shutdown, when removing power supply (USB connector) data is lost.

1.1.4. MIX commands

All commands described in TAOCP Vol. 1 are implemented (s. table 1.1.4) with execution times corresponding to Knuth's specifications. Special care is given to the correct timings. Even the "sofisticated" commands **SRC** and **SLC**, which need a modulo 10 computation are executed in the defined timing of two cycles.

The system can (easily) be extended in various ways:

1. add more commands:

- logic operators: **AND**, **OR**, **XOR**, **NOT**
- **JrE,JrO** jump if Register r is even/odd (done)
- Floating point arithmetic: **FADD**, **FSUB**, **FMUL**, **FDIV** (done)
- Floating point compare: **FCMP** (to do)

2. add more hardware:

- add leds to run the traffic light example (s. chapter 5 of this manual)
- add more I/O unit

1.1.5. The GO button

MIX comes with the *GO button* attached to USB-UART. So after pressing the *GO button* MIX-programms can be uploaded by sending the *punched cards* to USB-UART.

Table 1: MIX commands

Command	OP	Field	Timing
NOP	0	0	1 <u></u>
ADD, SUB, MUL, DIV	1, 2, 3, 4	0:5	2 <u>, 2u, 10u, 12u</u>
FADD, FSUB, FMUL, FDIV	1, 2, 3, 4	6	4 <u>, 4u, 9u, 11u</u>
NUM, CHAR	5	0, 1	10 <u></u>
HLT	5	2	1 <u>u or ∞?</u>
SLA, SRA, SLAX, SRAX, SLC, SRC	6	0—5	2 <u></u>
MOVE	7	F	(1 + 2F) <u></u>
LDr, LDNr	16—23	0:5	2 <u></u>
STr	24—31	0:5	2 <u></u>
STJ	32	0:2	2 <u></u>
STZ	33	0:5	2 <u></u>
JBUS, JRED	34,38	U	1 <u></u>
IOC	35	U	1 <u></u>
IN, OUT	36,37	U	(1 + T) <u></u>
JMP, JSJ, JOV, JNOV, JL, JE, JG, JGE, JNE, JLE	39	0—9	1 <u></u>
JrN, JrZ, JrP, JrNN, JrNZ, JrNP, JrE, JrO	40-47	0-7	1 <u></u>
INC _r , DEC _r , ENTr, ENNr	48—53	0-3	1 <u></u>
CMP _r	54—63	0:5	2 <u></u>

1.1.6. The toast case

MIX comes in a nice case with formfactor of a slice of toast (10 cm × 10 cm × 2 cm), so your complete MIX computer system will easily fit into your lunch box. The case can be printed with a 3D printer. Design files can be found in the directory `build/toast` of the project site.

2. Running programs on MIX

2.1. tools

To run mixal programs on your MIX the following tools found in `mixal/tools`⁵ are needed:

- `asm.py`: translates the mixal program into numeric representation (`.mls`).
- `mls2card.py`: translate the machine code (`.mls`) to punchcard format. The first two cards beeing the loading routine (1.3.1.ex26) and the last card beeing the transfer card.

⁵www.gitlab.com/x653/mix-fpga

- `mls2char.py`: translate to character codes, which can directly be read by MIX. (This is only necessary for the card-loading routine written on the first two punch cards).
- `mls2bin.py`: translate the `.mls` file to binary. This is only necessary for the GO button, which is hardcoded into fpga ROM.

2.2. V1: upload and run in a screen session

Finally you can connect your PC to MIX with a USB cable and start the terminal emulator (`screen`):

```
$ screen /dev/ttyUSB0 115200
```

Press the *GO button* to start MIX. You should see the MIX welcome message:

```
1 | WELCOME TO MIX. 1U = 40NS. U16-U20 TO UART @115200 BAUD (8N1).
```

If `screen` does not open the terminal try with `sudo screen`. This might happen, when the user is not allowed to acces the device `/dev/ttyUSB0`. Check the user setting of `/dev/ttyUSB0` and add the user to the dialout group `sudo usermod -a -G $USER dialout`.

Within the screen session you can upload the mixal programs written on punch cards:

```
<ctrl-a> : readreg p p.card
<ctrl-a> : paste p
```

2.3. V2: Upload and run using the Makefile

As an alterntive to `screen` you can send jobs to MIX using a `Makefile`. Every tested program comes in a subfolder with a corresponding `Makefile`, which can be used to compile, upload, and run the program on MIX.

- Connect MIX to USB
- Press the GO button
- run the Makefile
- the output is stored in a `.out` file

```
$ make clean
$ make
```

2.4. Verify

MIX has been verified with the following programms. The numbering correspond to the sections in TAOCP.

- 1.3.1ex26 card-loading routine
- 1.3.2P table of primes
- 1.3.2E easter dates
- 1.3.2.ex13 cryptanalyst problem (classified)
- 1.3.2.ex16 sum of harmonic series
- 1.3.2.ex20 josephus problem
- 1.3.2.ex22 traffic signal problem (driving real LEDs)
- 1.3.3A multiply permutations in cycle form
- 1.4.2 character input routine

3. Example program 1.3.2P

We will run programm P of chapter 1.3.2 TAOCP (p. 148) on MIX. Programm P computes the first 500 primes and outputs them in a table on the line printer U18.

3.1. Prepare the input

3.1.1. p.mixal

The mixal program can be found in `mixal/1.3.2P/p.mixal`:

```
$ cd mixal/1.3.2P
$ cat p.mixal

1 * EXAMPLE PROGRAM ... TABLE OF PRIMES
2 *
3 L      EQU  500
4 PRINTER EQU  18

52      END  START

```

3.1.2. p.mls

First we translate the mixal programm to binary code. This is done with the translator `tools/asm.py`.

```
$ ./tools/asm.py p.mixal
$ cat p.mls
```

```

1      0001 * EXAMPLE PROGRAM ... TABLE OF PRIMES
2      0002 *
3      0003 L          EQU  500

```

```

3.1.3. p.card

Next we must write the binary code onto punched cards. This can be done with the python script `mixal/tools/mls2card.py`. The python script reads the listing file `p.mls`, extracts the numeric codes and writes them in the file `p.card` in puncher card format.

Every line of `p.card` holds 80 chars of a card. The first two cards contain the card loading routine discussed in exercise 26 in chapter 1.3.1 of TAOCP. The last card is the so called transfer card, which tells the bootloader to start execution at memory location 3000.

```
$ ./tools/mls2card.py p.mls  
$ cat p.card
```

3.1.4. go!

Power MIX with USB cable connected to your computer. Start a screen session with 115200 baud (8N1)

```
screen /dev/ttyUSB0 115200
```

Press the *GO button* on MIX. You should see the welcome message on your terminal:

```
1 | WELCOME TO MIX. 1U = 40NS. U19 @115200 BAUD (8N1).
```

3.1.5. input the cards to U16

You can now send the punched cards to MIX within the screen terminal session. Read cards into a screen-buffer (called p) and send the buffer to MIX.

```
<in screen terminal> Ctr-a : readreg p p.card <enter>
<in screen terminal> Ctrl-a : paste p <enter>
```

After a short amount of time MIX spits out the following table to the printer U18. Notice that output to U18 have 120 characters per line, while output to the terminal U19 is only 70 chars wide.

```
1 | FIRST FIVE HUNDRED PRIMES
2 |   3000 0233 0547 0877 1229 1597 1993 2371 2749 3187

```

3.2. Congratulations

You have run your first program on a *real* MIX.

3.3. Using Makefile

With the included **Makefile** the above described steps can be done in one pass:

- Connect MIX to USB
- Press the GO button
- run the Makefile: `$ make`
- the output is stored in `p.out` file

4. Build your own MIX and/or modify the fpga design

The project runs on iCE40HX8K-EVB fpga from Olimex Ltd. The whole project uses only FOSS soft- and hardware. With little modifications it should run on any fpga board available out in the wild.

4.1. Requirements

1. fpga board (iCE40HX8K-EVB)
2. programmer device (Olimexino 32u4) with idc10 cable (cable-IDC10)
3. USB-UART-board (BB-CH340T).

4. fpga toolchain. The project was developed with `apio`⁶, a software suite based on project icestorm⁷ from Clifford Wolf.

Consider to buy at Olimex Ltd.⁸, the company with the highest number of registered OSHW-projects. Install the tools with:

```
$ sudo pip install -U apio
$ apio install ice40
$ apio install iverilog
$ apio install scons
$ apio install yosys
$ sudo apt install gtkwave
$ cd tools/iceprogduino
$ make
$ sudo make install
$ sudo apt install screen
```

4.2. FPGA iCE40HX8K-EVB

Build the project and upload the circuit design to the fpga:

1. cd into the directory `rtl` and build the project

```
$ cd rtl
$ apio clean
$ apio build -v
```

2. Connect the fpga board with olimexino-32u4 programmer to upload the bitstream file. Use two USB cables to power both boards as shown in fig. 4.
3. Upload the bitstream file to fpga board.

```
$ cd build/rtl
$ apio clean
$ apio build -v
$ apio upload
```

⁶github.com/FPGAwars/apio

⁷www.clifford.at/icestorm

⁸www.olimex.com

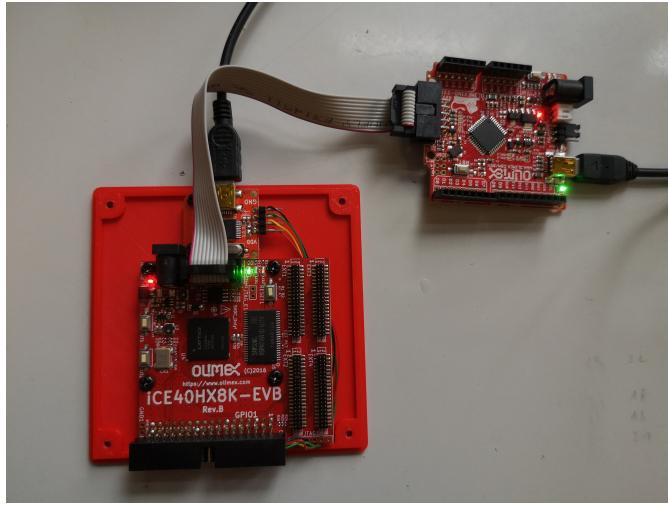

Figure 4: Connect programmer Olimexino-32u4 with fpga board iCE40HX8K-EVB

4.3. The USB-serial adapter

The serial adapter BB-CH340T is used to:

1. Power MIX with 5Volt from USB cable
2. Serial communication to MIX over I/O Unit 16-20.

To use USB-Serial adapter as power source we must do a little modification on the board according to Fig. 5:

1. cut with a cutter knife the connection marked in GREEN, and
2. solder a bridge BLACK between the right most terminal (VDD) and the 5V pad.

This will ensure that the right most terminal connector (red cable) get's 5Volt form USB, which will be used to power the fpga board. But the UART signals (green and yellow cables) are still leveled to 3.3V, which corresponds to the in-/output signal level of fpga-connector GPIO1.

The 4 wires are connected to the GPIO connector on the right side of iCE40HX8K-EVB according to the following table. Compare with schematic in the appendix B.

color	USB-serial	GPIO (ICE40HX8K-EVB)
black	GND	2
green	RX	7
yellow	TX	5
red	VDD	1

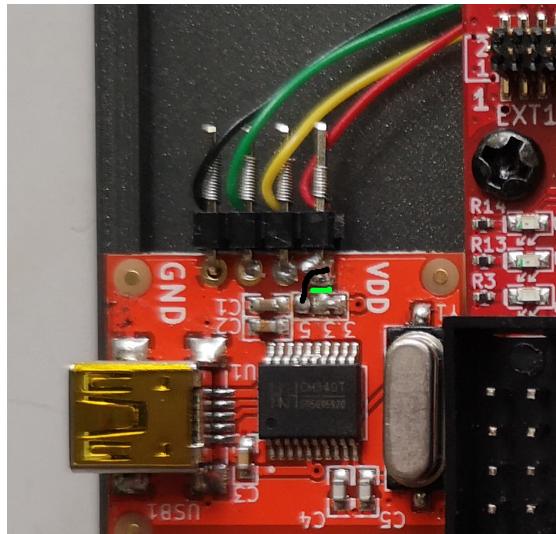

Figure 5: Cut the pcb track (GREEN) and solder a bridge from 5V pad to the right most connector pin.

4.4. The Go button

We will implement the code needed by the go button proposed in exercise 26 in chapter 1.3.1 of TAOCP (see p. 510).

4.4.1. prepare the software

The mixal program can be found in `go/go.mixal`. It starts at location 4000 (which is implemented in fpga but not used by MIX). The programm spits out the welcome message. The JMP instruction at memory cell 4095 will jmp to location 0 storing a +0000 in the J-Register, because beeing a binary version with 12 bit programmcounter the next execution address without the jmp instruction would equally yield $4095 + 1 = 0000$.

```

1      ORIG 4000
2      JMP  START
3 WELCOME ALF  WELCO
4          ALF  ME TO
5          ALF  MIX.
6          ALF  1U =

26      WELCOME EQU 4001
27      START   EQU 4091
28      NEXT    EQU 4093

```

Next we must translate the binary code into a binary format readable by the fpga toolchain. This can be done with the python script `mixal/tools/mls2bin.py`.

```

$ ../../mixal/tools/mls2bin.py go.mls
$ cat go.bin

```

The python scripts reads the listing file `go.mls`, extracts the code and writes it in the file `go.bin`.

Inspect the binary file ‘go.bin’

```

4090 | 00000000000000000000000000000000
4091 | 00000000000000000000000000000000
4092 | 0111110100001000000010001100101
4093 | 011111111100000000010001100010
4094 | 000000000000000000010000100100
4095 | 011111111110000000010000100010
4096 | 00000000000000000000000000000000100111

```

The output contain the program code expressed as binary numbers. These binary numbers can be flashed to the iCE40HX8K-EVB board, so it will be stored permanently in the MIX computer. At every reset (press *Go button*) the code will be executed. The first 4000 zero lines translate to NOP instructions. At the end you find the sequence IN(16),JBUS,JMP...

4.5. build and flash to iCE40HX8K-EVB

- Copy the binary file `go.bin` into the directory `rtl`, where the fpga description files are.
- Rebuild the fpga project and upload. An `apio clean` is needed, because otherwise the preloaded memory will not be updated.

```

$ cp go.bin ../../rtl/go.bin
$ apio clean
$ apio build -v
$ apio upload

```

Tipp: change the welcome message to ensure the new rom file has been uploaded.

4.6. print toast case with a 3D printer

In the subfolder `build/toast` you find printing files for the case. The case consists of three parts:

- `bottom.blend`: the bottom part of the case
- `top.blend`: top part of case
- `go.blend`: go bottom

Figure 6: MIX fits in nice toast like case

5. Example program 1.3.2.ex20T

We will run programm T of exercise 20 in chapter 1.3.2 TAOCP (p. 161) on MIX. Programm T controls the traffic signal at corner of Del Mare Boulevard and Berkeley Avenue. This project will connect LEDs directly to the register rX and a push button to the Overflow toggle. This will be done extending the fpga design and routing the appropriate signals to the GPIO connector at the back of MIX.

5.1. Extending the fpga desing

Make a copy of the folder `rtl` and `cd` into it.

```
$ cd build
$ cp -r rtl rtl_traffic_light
$ cd rtl_traffic_light
```

5.1.1. mix.pcf

Find the following lines in the physical constraint file `mix.pcf` and uncomment to get access to the GPIO pins 9-19.

```
15 #set_io dmred    F5  # GPIO 9
16 #set_io bred     J2  # GPIO 10
17 #set_io dmamber  B1  # GPIO 11
18 #set_io bamber   H1  # GPIO 12
19 #set_io dmgreen  C1  # GPIO 13
20 #set_io bgreen   G1  # GPIO 14
21 #set_io dmdw     C2  # GPIO 15
22 #set_io bdw      J5  # GPIO 16
```

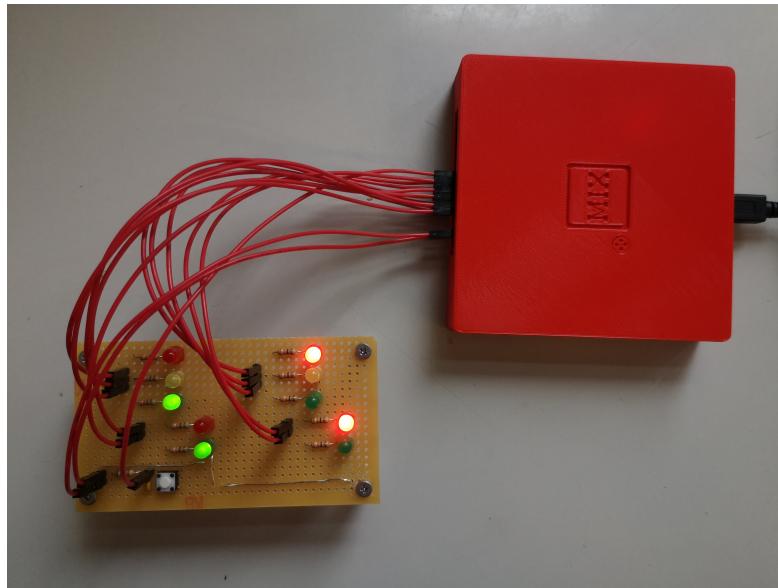

Figure 7: Connect LEDs and push button over the GPIO connector directly to register rX to control the traffic light

```

23 | #set_io dmw      F4  # GPIO 17
24 | #set_io bw       H2  # GPIO 18
25 | #set_io button   D2  # GPIO 19

```

5.1.2. mix.v

To connect the Register rX with the traffic signals: find the following lines (28–38 and 47–56) in `mix.v` and uncomment:

```

20 // MIX
21 // Don Knuth's computer architecture described in "The Art of Computer Programming"
22
23 'default_nettype none
24 module mix(
25     input wire clk_in,
26     output wire tx,
27     input wire rx,
28 //    output wire dmgreen,
29 //    output wire dmamber,
30 //    output wire dmred,
31 //    output wire bgreen,
32 //    output wire bamber,
33 //    output wire bred,
34 //    output wire dmw,
35 //    output wire dmdw,
36 //    output wire bw,
37 //    output wire bdw,

```

```

38 // input wire button,
39 // output wire hlt,
40 // output [17:0] sram_addr,
41 // inout [15:0] sram_data,
42 // output sram_cen,
43 // output sram_wen,
44 // output sram_oen
45 );
46 // assign dgreen = RegisterX[19:18] == 2'd1;
47 // assign dmamber = RegisterX[19:18] == 2'd2;
48 // assign dmred = RegisterX[19:18] == 2'd3;
49 // assign bgreen = RegisterX[13:12] == 2'd1;
50 // assign bamber = RegisterX[13:12] == 2'd2;
51 // assign bred = RegisterX[13:12] == 2'd3;
52 // assign dmw = RegisterX[7:6] == 2'd1;
53 // assign dmdw = RegisterX[7:6] == 2'd2;
54 // assign bw = RegisterX[1:0] == 2'd1;
55 // assign bdw = RegisterX[1:0] == 2'd2;

```

Control the overflow toggle with the button by uncommenting line 239 in the code snippet:

```

237     always @(posedge clk)
238         if (reset|clearof) overflow <= 0;
239     //     else if (button) overflow <= 1;      //the traffic signal button controls the overflow
240         else if (add2 & addof) overflow <= 1;
241         else if (div2 & divof) overflow <= 1;
242         else if (ide & (rA|rX) & ideof) overflow <= 1;
243         else if (fadd2 & faddof) overflow <= 1;
244             else if (fmul2 & fmulof) overflow <= 1;
245             else if (fdiv2 & fdivof) overflow <= 1;

```

5.2. rebuild and flash to iCE40HX8K-EVB

Rebuild the fpga project and upload.

```
$ apio clean
$ apio upload -v
```

Tipp: change the welcome message to ensure the new rom file has been uploaded.

5.3. add leds and button to GPIO

Connect leds and button (don't forget resistors) to the appropriate GPIO connectors as described in the `mix.pcf` file. For simplicity only one LED is shown below:

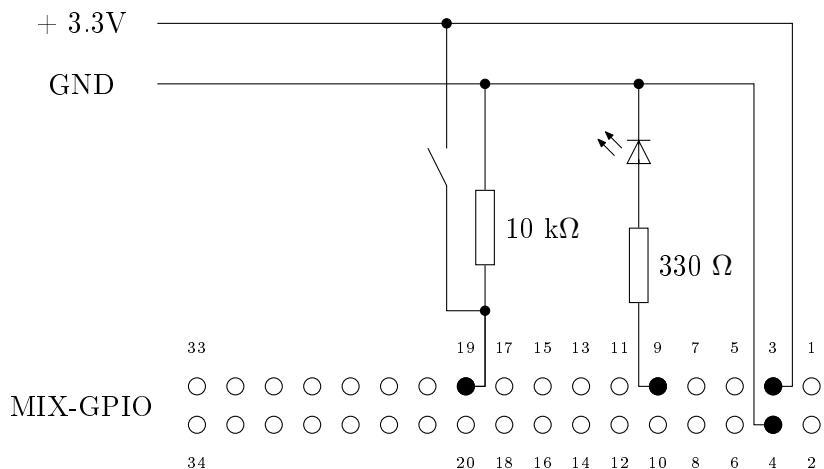

Figure 8: connect LED and button to GPIO connector

Attention: gpio pins 1,2,5 and 7 are already used by the internal USB-serial converter.

5.4. t.mixal

Compile and write `mixal/1.3.2.ex20/t.mixal` to puching card format. Start MIX by pressing the *go button*. Upload `t.card` to MIX and see the traffic signals blinking.

6. Service

In case you encounter an issue with MIX:

- don't panic
- plese send an email to the author⁹ with a precise description of the problem.

7. License
